03/03/2026 Agenda

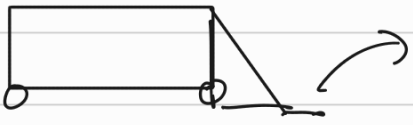

- Pcb build on pre-existing
- Pcb orders
- Strategy (Bespreek hierdie sonder die ander sumobot studente teenwoordig?)

→ Speed
→ Drive force
→ Friction resistance

The sumobot should find a way to crawl beneath its opponent and flip it over or shove it off.

The shoving mechanism can easily be solved with electrical components, but the crawl mechanism is mostly mechanical.

→maximize weight
→minimize size

some form of down force can be applied
↖as close as possible to the ground

The bot that manages to apply the most down force if they go head to head will manage to flip the other bot.

Finding a way to lessen the friction of it scraping against the ground plays a key role.

↑ dipping the scraper in some form of lubricant?

- Hinged fork vs simply optimizing driving force once underneath opponent
